Other features

Rebrandable software

- By editing one PHP file, the footer and title will both be updated all over the site.

Multi-language implementation

- You can create your languages and add them. We provide you with PSD sources so you can edit images, too.

Homepage

- All on-line performers are listed on the homepage.
- By clicking on "Switch to live previews" you get to view live streaming from each performer (live avatars). Users can also switch to modern previews, where all performers are shown in a friendly interface – online performers are shown first.
- If performers do not upload an avatar, a default image will be shown
- By hovering the mouse over these images (avatars), you get to see important details about the performer, like "Private chat cost", "Performer category", "Spoken languages", "Sexual orientation", "Age" and "Views"
- "Private chat cost" will appear only if admin allows custom payment plans (performers can set their own price per minute) and private conversations. The value represents chips per minute.
- "Performer category" represents the show type performed by the model E.G. Lesbi, threesome, etc. This value is chosen by the performer at signup and can be set only once.
- "Views" value represents the number of users that accessed the performer in a chat session
- The red text under the image/live streaming represents the performer's nickname
- The second chat button, under the "Private show" button is the multiple user chat button. If performer is in nude chat, then the button will show as "NUDE CHAT" or else "FREE CHAT".
- If a performer is in nude chat she won't be displayed in the live previews, protecting her from abuse.
- If users will try to access a private show and they have insufficient funds for that session (minimum time set by admin) will get redirected to Order chips page.
- If performer is in free chat, any unlogged visitor can join the session. If a visitor will try to access any paid chat session he will be redirected to login/signup page.
- The bottom of the page contains random free/paid videos.

Our models

- On this page all performers (except suspended and performers that didn't create a profile) are shown
- By clicking on a performer we will see his/her profile

Performer's public profile

- Public profiles can be seen here with different info about the performer(s).
- On the lower part of the page personal profiles for each performer can be seen. E.G. for Lesbi category: 2 entries.
- The schedule page will display the performer's on-line schedule, if set
- Performers can upload up to X photos which will be automatically resized. X number is set from administration area.
- Video gallery displays videos that were recorded by performers during chat sessions. These videos are hosted on FMS.
- Private videos are available to users, so performers can earn money even if they are offline. Users pay per view, each time they access a video.
- Logged users can add the performer to favorites or remove from favorites if already exists
- Performers can choose if they want their phone number and e-mail to be posted on their contact page. E-mail addresses are posted with spam protection.
- The administrator can set if only registered or all users should access video and photo galleries.
- Performers without a valid profile won't be shown on the site, only in live chat if they're on-line.

Favorites

- Favorite performers will appear for each logged user on this page. By clicking on one you will be redirected to the profile page

Order chips

- Logged users can purchase chips
- This is where the payment processor will be integrated

My Account

- This page redirects unlogged users to the login page. Logged performers/users will be redirected to their account homepage

User - My Details

- Users can update their personal info, except e-mail address

Users - View live performer

- Users can chat with performers and view/hear them live.
- There are 3 types of chat sessions: free public, nude and one-on-one private. Performers can go in nude chat or in free chat. Nude chat allows more paying users to the chat room.
- In order to save bandwidth, make the system more safe and get money from users, different types of users can attend for a limited period of time to free sessions. These are the user types: unlogged users, logged users with no available chips and logged users with available chips. The limits can be changed from administration area.
- There are 2 video sizes users can choose from. Both of them are small or large enough in order to avoid quality loss.
- Unlogged users can select their usernames when going in a free chat session and logged user's nicknames are automatically set as their usernames.
- During private shows, users can also broadcast their live video streaming to performer so they can view each other. During this, the larger video image can be switched easily by clicking the switch button.
- While in private chat, users can broadcast their live streaming so there is a one-on-one videoconference. Administrator can instantly disable this feature from theme.xml, variable webcam2webcam.
- Users can view under the flash component money and time statistics: performer's private chat rate, your account balance, available private chat time and time left in private chat (ajax real time).
- Users can vote performers on this page, without the need to reload their browsers. A vote can only be recorded once in 24 hours.
- Users are able to tip performer by purchasing them something from the shop. This is a more user friendly way to tip performers instead of typing the number of chips you want to send to performer. After a product has been billed, performers will be notified with a yellow text above the flash chat about this for 10 seconds.

User - My statement

- Users can view all their paid chat sessions and all the account funding history
- Manually added/removed chips (by administrator) will also appear here.
- For manually removed chips, the "Amount" value will be less than 0. E.G. "-80 Chips"

Users and Performers - Messenger

- Users and performers can send private messages to one another
- Only users can contact performers (performers can't contact other performers or users) by clicking their profile contact link
- The bad words filter is also active here (words are loaded from the `censure.xml` file). Words that ban users inside the chatroom will cause the message not to be delivered to the initial recipient but it will get redirected to administrator, without user's knowledge.

Contact us

- Users can mail you here. You will receive all the questions to "From e-mails (address)" value in Configuration page from administrator's area
- This page is common for both users and performers

Performer - Go online

- From this page performers can go on-line. They are required to choose which web cameras to use and what bandwidth to use. After clicking "Done" they will appear as on-line on home page.
- Users will view all live webcams at once or if they click on 'Full screen' button they will one at once. By using the keyboard arrows or the image arrows they can switch between cams.
- If a user will go on a private show with a performer, all other connected users from that multiple chat session will get disconnected, a specific sound will warn the performer and she/he will disappear from the home page. A small blinking description will be shown on the right corner of the performer's flash screen representing the chat session type. After the user leaves the private session, the performer will be asked when to appear available again, so she has time to dress and prepare for free/nude sessions.
- Performers can kick or ban users. After banning a user, he won't be able to access that performer for a period of time specified in the administration area - configuration - "Webchat ban period (seconds)".
- Users banned more than 5 times will be automatically be banned from the whole site and their IPs will appear in the blacklist in administration > configuration.
- Whitelisted IPs won't get banned and they will be able to see all performers, even if they are situated in performer banned countries.
- Performers will see in the userlist while being on-line the number of chips (in brackets) for each connected user. This way she will know to whom to talk to with the purpose of having longer private sessions, earning you more money.
- Each user received a custom color in the chat session, making the life easier for the performer, she will be able to read and understand faster the text messages.
- 3 types of bandwidth/quality streams are available for performer at login. You can modify all values from `theme.xml` file.
- When a private chat is started, performer will hear a bell, letting her know she's got to perform.

- When in private, performers will see above the flash component maximum available private time (ajax real time). This way, they will know how much they can talk to user and what to do in a limited period of time.
- You may enable a bell ring like in private chat, when a user joins. The variable that edits this option is `public_sound` in `theme.xml`
- You can enable a bandwidth-saving plan while performers have no users connected. While in stand-by, the resolution is very low but when a first user joins the room, the quality is automatically improved. You can enable this feature in `theme.xml`, variable `decoy`.

Performer – MP3 player

- Performers can choose to play music during their shows. This way they can perform striptease or create a more user friendly environment, attracting more potential clients.
- The user's music is always synchronized with the performer's, even if the user joins sometime during the song. The MP3s are streamed directly from the HTTP server for both users and performers, keeping the quality intact.
- Administrator must upload music files to the system. We highly recommend to use a low encoding for the tracks, like 64kbits maximum since it's direct streaming so the video quality won't be affected.

Performer - My settings

- If custom pricing is allowed by the administrator, performers will be able to edit that value of both the private chat and nude chat (if nude chat is enabled by the administrator).
- Schedules allow performers to create a schedule visible on their profile page
- Public profile can be updated here. The first picture is the avatar and the next 5 are the larger ones, visible in the profile page only.

Performer – banned countries

- Performers can select countries they want to ban so users originating from a banned country won't see her online, in models list or in favorites.
- Whitelisted IPs will be able to view all performers, ignoring this limitation.

Performer - My Payments - My paid sessions list

- This is the list of all paid sessions.
- Payment status is pending if money weren't dispatched, yet.

Performer - My Payments - My payments list

- This is the list of all the dispatched payments

Studio accounts

Studios can sign up with your site and add new performers. They will receive money from you and they will pay their performers individually. Studios can track in ModenaCam interface payments they owe to their performers like administrator can track payments to independent performers. Monthly and detailed statistics are also included.

Please refer to 'Chips, billing and videos' document for more info regarding studios.

Affiliate accounts

Affiliate accounts let your partners send traffic to your site and earn a percentage of what referred users spend.

Please refer to 'Chips, billing and videos' document for more info regarding affiliates.

Administration area - Home

- This welcome page displays general statistics
- You can view real-time statistics regarding on-line users/on-line performers

Administration area - Spy on performer

- Administrator can view on-line performers and he can spy on their chat sessions 100% stealth. He can view performer live video, users list and the chatbox. He can ban and kick users without anyone's knowledge.
- Under the Flash component there is a list with all users connected to that chat room, their IPs and the originating country (real time with 30 seconds max. delays). You can easily permanently ban them.

Administration area - Performers or Users

- This page displays all the performers
- "Spy performer" button will be set to "View" if that performer is online. You can view/hear/read the chat session, no matter if it's private or public and you won't be shown on her on-line users list.
- "Order by" feature will cover both performers and users - it's enough to set it once. It will go back to default with the logout.
- "Search users" feature is a Google like search form with all the words.

- You can view specific performers by clicking on the "View new performers" or "View performers that need to be paid" links

- In performer's page you can set a performer to be marked as online or offline in the home page. This tool can be found useful if the FMS server has been restarted and performers are still marked as online, even if they are disconnected or you want to give the impression that you have many on-line models. Note that when switching to 'live previews' the loading screen won't disappear as no one is broadcasting.

Administration area - Edit performer

- You can edit a performer's belonging studio in top of this page. You can also view current studio owner in 'Owner' info line.

- By clicking on a performer's username from the previous page you will get to Edit performer page. You will see general statistics for that performer here.

- If the performer didn't complete the payment options, you will see an error message: "This user has invalid payment type values"

- Pay performer link will take you to the page where you notice the performer for dispatching the money. The account balance for the performer will be set to 0 and all the paid sessions until that day will be marked as paid.

- On the bottom of the page you will see the statistics for that performer: Paid sessions list and payments list, as in 'Performer - My Payments - My paid sessions' list' and 'Performer - My Payments - My payments list'

- You can view performer's videos, edit their individual pricing, set them as free or paid, viewing and delete them.

Administration area - Edit user

- The fields here are almost the same as the performer's edit page. You can see the paid sessions and the chips order history for the user.

Administration area - Configuration

- You can manage the products in the shop. Each product must contain an image.

- "Default affiliates status", "Default user status", "Default performer status" , "Default studio status" values represents the default value for a user signup

- "Allow new affiliates to login", "Allow new users to login", "Allow new performers to login", "Allow new studios to login" will allow or forbid users with "new" status to login. This gives you the opportunity to moderate new signups. NO = moderate new users.

- "Max. chat logs per performer" is the maximum limit of logs each performer will have. It is recommended that you set a limit because you will optimize the database as chat logs can become very space consuming.

- "Free chat max. session for unlogged users (seconds)" represents the number of seconds an unlogged user can chat with a performer on a free session.
- "Free chat max. session for logged users (seconds)" represents the number of seconds a logged user without available chips can chat with a performer on a free session.
- "Free chat max. session for paying users (seconds)" represents the number of seconds a logged user with available chips can chat with a performer on a free session.
- "Webchat ban period (seconds)" sets the time a banned user cannot join a chat with the performer who issued the ban.
- "Max. number of pictures/videos a performer can upload" is the limit of images in performer's photo gallery.
- "Max. picture filesize upload in Megabytes" is the limit of each image size uploaded by performers. They will be automatically resized, but this might affect your server's performance if set too high.
- "Max. messages a user/performer can have" is the limit of private messages a user/performer can have in their accounts.
- "Secret hash" is an internal value used for security reasons and it must be set once, at the installation with a random string of letters and numbers. Do not change it or the system will malfunction. Refer to installation doc for more information.
- "Currency code" is the currency symbol that will appear all over the site. The updates are immediate.
- "Photo and video gallery user limitation" filters users that can view performers' galleries.
- "Whitelisted IPs" are the IPs that can view all performers on the site, even if IP comes from a country that has been banned by performers. Also, whitelisted IPs won't get banned in chat rooms.
- "Banned IPs" can't access any page of the site. The list is also automatically populated by users who get banned more than 5 times.
- "Enable nude chat" switches this option for performers. If disabled, performers will be able to go online only in free chat.
- "Nude chat cost" - this is where you set whether multiple user chat should be paid or not
- "Private chat cost, chips / minute" - this is the price (chips/minute) for private chat sessions
- "Minimum chat time (minutes)" - the minimum chips to buy for a session. E.g. a user stays in private for a few seconds => he will be billed for a minute.
- "Minimum chips to buy" - the minimum amount of chips a user can buy
- "One chip cost (\$)" - this is the price per chip used internally.
- "Your percentage of each paid session" - How much you get from each user-performer transaction
- "Affiliate's percentage of each paid session" and "Affiliate's percentage of each account fund (type #2)" are the commissions for affiliate programs.
- "Performer custom payment settings" options allow performers to set their own pricing for nude chat, private chat and paid videos from a range of values you set. If this is enabled, "Nude chat cost, chips / minute",

“Private chat cost, chips / minute” and “Paid video cost, chips/video access” will become unused and default values in performer’s custom pricing fields.

- "Number of e-mails to send as newsletter/script run" - the number of e-mails to send for each script run (by cron).

- "From e-mails (address)" - this is an important variable: all the signup e-mails and support e-mails will be identified as sent from this address

- "Max. messages a user/performer can have:" - this variable limits the messages from the Messenger page both for performers and users

- "Secret hash:" - this should be a random string, the same as in main.asc file - rec_send.hash variable, internally used for security reasons.

- "Currency code:" - this is used as currency symbol all over the site

- "Photo and video gallery user limitation:" - the maximum number of photos a performer can upload

- “Banned IPs:” – list of permanently banned IPs, one per line. IPs that are banned more than 5 times by performers will automatically be added to this list.

Administration area - Payment types

- You can edit all the payment options for performers. The fields will appear in performers’ signup and Edit payment info pages

Administration area - Newsletter

- You can send newsletter mail to your users.

Other features

- The colors from the flash chat sections can be edited in a XML file

- The footer of each page - the small menu and the copyright text can be easily changed from one PHP file

- The streaming options (bandwidth values) for performers can be edited by administrator

- Efficient newsletter, can send an unlimited number of e-mails, you can tune depending on the server's performance

- There are small security features like limited account creation from the same ip.

- You can add an automatic welcome message when a user joins the chat (only new users in the room will see that) from administrator or from performers in theme.xml file, variables welcome_message and admin_message. If you don’t enter anything between the “”, no messages will be posted.

- Auto banning feature: users that get banned more than 5 times, will automatically be added to the permanent bans list.
- You can define words that are not allowed to be typed in a chatroom. This way you can have a better control on your business. You can use 2 lists of forbidden words: words that will be replaced with stars if typed and words that won't appear and will cause a temporary ban of the user. The same list is used to filter words in private messaging system. Messages containing banned words (not the censored words) won't be delivered, even if user is informed that it has been and the copy of the message will be dispatched to administrator.
- Detailed manuals for performers and studios. The system is self-explanatory for users and affiliates.
- A RSS feed is available with all on-line performers by accessing www.yoursite.com/rss.php.
- Extended logging is recorded into the database for every live video authentication for 30 days. Administrator will be e-mailed every time a problem occurs.
- Mass chips manager gives administrator the power to add/remove chips from certain users (All, new, active, suspended or users that ever bought chips).
